

## Flashphoner - do you know what it is

In advanced world, information development is so rapid, that to keep up with it is very, very stubborn. As we know, who owns the information, those own the world. No one will deny that it is impossible to know everything. Still, it is possible to strive for this. This article commences readers to such concepts as Flashphoner. Flashphoner is a Flash-SIP server. This server software permits you to develop [flashphone](#) and click2call buttons. Flashphoner is sole in the fact that it tie any flash application with any sip client. It means, Flashphoner is a [Flash-VoIP gateway](#). Flash-VoIP which allows you to call from any Flash applications to phones. The complexity and uniqueness of design are shown in few things. First, transcoding codecs (Speex, Sorenson Spark, H.263). Flash player and regular phones (or softphones) have different codecs. Flashphoner can transcode one codec to another. It is transcoding from Speex codec to the codec G.711 in the case of audio call, and Sorenson Spark codec to codec H.263 transmission if there is videocall. Both of these transcodes (Speex-G.711 and Sorenson Spark-H.263) are processed on the server part and does not load the client application. One more thing is SIP 2.0 support. Protocol SIP is the centre of Flashphoner. SIP support makes it possible to call anywhere with aid of Flash player. Flashphoner is working on the RFC 3261 measurement. At this point, the protocol SIP is the best protocol for the correlation and for any other calls. [Flash sip gateway](#) also supports some features such as call hold, call on multiple lines, union calls and much more. Flashphoner usage on the site frequently requires automatic control of the phone application. Flashphoner also involves Flashphoner client - Flashcaller. Flashcaller application has a multipurpose Java Script API so you can easily monitor webphone by website pages scripts. When you give users a new feature - be ready for effect. When a thread calls will intensify by several times, you can easily settle the load on Flashphoner, placing it on compound servers. In the age of rapid changes, any software is valuable not only by its features but what is more important by option of integration into the existing complex. Now, with calls from a site through Flashphoner, many people will come to the Internet, even those who previously could not comfortably and quickly get information from internet. These undemanding services are on demand among people and businesses, who do not know a lot about the complex registration on the voip providers site, as well as download and install special desktop applications. Flashphoner is the best way out on the market with such a reasonable value and money combination. You can accept calls from your website just today!

## About the Author

In advanced world, information progress and [voip](#) communication is so rapid, that to keep up with it is very, very difficult. As we know, who holds the information, those own the world.
